

VMS Integration Application Note

IDCUBE, the global leader in physical access control security has partnered with Milestone, the market leader in IP video management software to offer an integrated physical security application platform leading to a single window monitoring & quick response time to an incident.

Architecture

Benefits

Streamlined Operations: A single window interface for managing the entire physical security operations of an organization, reducing time spent on managing systems via standalone applications.

Instant Response: Administrators may easily lock, unlock or choose to lockdown the facility or a particular floor while viewing the camera clips through the same window.

Access Notification: Leverage the facility of configuring access notification behavior by mapping it with speaker, microphone, sound alerts, in addition to camera and custom commands for better communication & reach.

Enhanced Perimeter Security: Cameras linked to perimeter intrusion sensors are automatically highlighted for quick investigation & subsequent counteractive actions.

Eliminate Tailgating: Prevents multiple entries with a single access through an integrated surveillance & access alarm interface.

Video-mapped Alarms: View live alarms from the access control & intrusion detection system along with their mapped video streams for precise situational understanding and consecutive response.

User Directory: Access the user directory with a single click for easy identification of users in the alarm-mapped video clips.

Simplified Management: Operators can easily manage the events, doors and cardholder functions on one page without switching back to the complicated administrative module of the integrated access control application.

Cost-efficient: IDCUBE Access360 & Milestone XProtect presents the best of the breed integrations of two global platforms providing functionalities of Physical Security Information Management, thus saving cost and resources involved in implementing a third-party PSIM application.
